Revision Wed:

1. Now modify your program in part 1 so that it displays the properties of a circle. More specifically, you will take the radius of the circle as an input from the user and will display the area and circumference of the circle.

2. Now in addition to what is printed out in part 3, first define and initialize a string as "War and Peace". Then write the code that will change this string to **"and War PeAce"** and display it on the console.
